

**Amendments to the Specification:**

Please replace paragraph [0023] with:

In order to receive the fax in auto receive mode 58, the IPP 30 needs to distinguish an incoming voice call from a fax call. If the fax call is initiated by a conventional fax machine 22 on a remote end, the IPP 30 looks for the CNG tone in the incoming signal. For a call initiated from an Internet-aware fax device (IAF) the IPP 30 looks for fax-specific signals. To detect the signal, ~~there is a hangover time~~—there is a hangover time during which the IPP 30 is looking for the fax-specific signals. If the fax signal is detected then the IPP 30 does not alert the user. Instead it stores the incoming fax in the memory 44 for the user to print at a later time.
